You can find more information within the Tor browser on their official website.Using Tor SafelyTor is a great browser for anonymous and unrestricted access to the internet. After all, it allows you to visit the dark web! However, greater freedom does come at the cost of increased risk. There are a lot of pages on the dark web that are perfectly fine to visit, but, like the rest of the internet, there are also a lot of scams. Cybercrime also runs rife on the dark web.Moreover, the dark web is not nearly as regulated and well-trodden as the surface web, because it's more or less assumed the "everyday internet user" isn't really to be found on such sites. Therefore, protecting your anonymity when visiting the dark web is critically important.Because of the above, we recommend using a few safety precautions. These are measures that we recommend to everyone, but even more so if they intend on using the Tor network for access to the dark web.1. Use reliable antivirus softwareFirst off, we recommend using good and reliable antivirus software. Remember, the fact you're using Tor means you're more anonymous. It doesn't necessarily offer any protection against malware and viruses. Moreover, if you happen to visit the dark web, you might come across some rather nasty malware at some point.2. Get a good VPNSecondly, we strongly recommend using a good VPN as well. After all, a VPN will route your data through an additional server that your data traffic is routed through, making you even more anonymous. Also, a good VPN will provide you with yet another layer of high-quality encryption, protecting your digital footprint even more.A great VPN we recommend for use with Tor is NordVPN. This VPN offers great encryption protocols, servers in 59 countries, and a very useful "Onion Over VPN" option. The latter allows you to connect to a NordVPN server and the Onion network with just one click.Lastly, regardless of the measures you've taken to stay safe, take extra care with links on the dark web. Never click or navigate to a link you don't trust. Or better yet, avoid navigating to links you don't know. The dark web links look very different from links on the surface web. They are just a bunch of seemingly random numbers and other characters since these links do not use public DNS to resolve. As such, it's much more difficult to know where a link will take you and if a site is safe.Therefore, we recommend checking out the Hidden Wiki if you're interested in visiting the dark web. This is a directory that contains many different dark web links and also explains where those links will take you.Always Protect Yourself When Visiting the Dark WebNow that you know how to install the Tor browser on your device, you can explore everything it has to offer. Please do so with caution, however, especially if you're intent on visiting the dark web. If you want to know more about the data that your device or browser is leaking, you can also use our free online anonymity tool to figure it out.
